Editor's note

Hans Joachim Freisleben¹,²,³

Recently, the World Association of Medical Editors (WAME) Board invited to participate in an important multi-journal project by publishing an editorial on nuclear risk and health. The editorial should be published within 3 months after the anniversary of the Hiroshima bomb on August 6.

As a member of the WAME, I signed up for the list of medical journals on behalf of Medical Journal of Indonesia after reconfirmation by our Editor-in-Chief, Agus Rizal A. H. Hamid, and our Managing Editor, Felix F. Widjaja, to participate in publishing this editorial. (¹Hans Joachim Freisleben, for MJI and the German-Indonesian Medical Association [DIGM])

According to the United Nations, the risk of nuclear weapons use is higher than at any time since the Cold War. At this moment of extreme danger, we are preparing to distribute an editorial on the role of health professionals in reducing nuclear danger. We hope to time the announcement of the release of this editorial on the anniversary of the bombing of Hiroshima on August 6 to underline the very real danger that nuclear weapons may be used again.

The editorial was co-authored by a group of journal editors and other supporters of the Nobel-prizewinning International Physicians for the Prevention of Nuclear War listed below. All of the authors’ journals will be publishing the editorial. The WAME Board agreed to support the publication of this editorial as widely as possible and to encourage all WAME members to join us in this unique declaration by the medical community.

Having so many respected journals around the world publishing the editorial should attract political and media attention. We hope that giving health professionals a more prominent voice in this debate will encourage profound changes in the system of nuclear arms control that has resulted in the current dangerous situation that threatens the health of people and planet. (Chris Zielinski, Project Manager, WAME)

Reducing the risks of nuclear war—the role of health professionals

Kamran Abbasi¹, Parveen Ali², Virginia Barbour³, Kirsten Bibbins-Domingo⁴, Marcel GM Olde Rikkert⁵, Andy Haines⁶, Ira Helfand⁷, Richard Horton⁸, Bob Mash⁹, Arun Mitra⁷, Carlos Monteiro¹⁰, Elena N. Naumova¹¹, Eric J. Rubin¹², Tilman Ruff⁷, Peush Sahni¹³, James Tumwine¹⁴, Paul Yonga¹⁵, Chris Zielinski¹⁶

In January, 2023, the Science and Security Board of the Bulletin of the Atomic Scientists moved the hands of the Doomsday Clock forward to 90s before midnight, reflecting the growing risk of nuclear war.¹ In August, 2022, the UN Secretary-General António Guterres warned that the world is now in a time of nuclear danger not seen since the height of the Cold War.² The danger has been underlined
by growing tensions between many nuclear armed states. As editors of health and medical journals worldwide, we call on health professionals to alert the public and our leaders to this major danger to public health and the essential life support systems of the planet—and urge action to prevent it.

Current nuclear arms control and non-proliferation efforts are inadequate to protect the world’s population against the threat of nuclear war by design, error, or miscalculation. The Treaty on the Non-Proliferation of Nuclear Weapons (NPT) commits each of the 190 participating nations “to pursue negotiations in good faith on effective measures relating to cessation of the nuclear arms race at an early date and to nuclear disarmament, and on a treaty on general and complete disarmament under strict and effective international control”. 

Progress has been disappointingly slow, and the most recent NPT review conference in 2022 ended without an agreed statement. There are many examples of near disasters that have exposed the risks of depending on nuclear deterrence for the indefinite future. Modernization of nuclear arsenals could increase risks: for example, hypersonic missiles decrease the time available to distinguish between an attack and a false alarm, increasing the likelihood of rapid escalation.

Any use of nuclear weapons would be catastrophic for humanity. Even a “limited” nuclear war involving only 250 of the 13,000 nuclear weapons in the world could kill 120 million people outright and cause global climate disruption leading to a nuclear famine, putting two billion people at risk. A large-scale nuclear war between the USA and Russia could kill 200 million people or more in the near term and potentially cause a global “nuclear winter” that could kill five to six billion people, threatening the survival of humanity. Once a nuclear weapon is detonated, escalation to all-out nuclear war could occur rapidly. The prevention of any use of nuclear weapons is therefore an urgent public health priority and fundamental steps must also be taken to address the root cause of the problem—by abolishing nuclear weapons.

The health community has had a crucial role in efforts to reduce the risk of nuclear war and must continue to do so in the future. In the 1980s the efforts of health professionals, led by the International Physicians for the Prevention of Nuclear War (IPPNW), helped to end the Cold War arms race by educating policy makers and the public on both sides of the Iron Curtain about the medical consequences of nuclear war. This was recognized when the 1985 Nobel Peace Prize was awarded to the IPPNW.

In 2007, the IPPNW launched the International Campaign to Abolish Nuclear Weapons, which grew into a global civil society campaign with hundreds of partner organizations. A pathway to nuclear abolition was created with the adoption of the Treaty on the Prohibition of Nuclear Weapons in 2017, for which the International Campaign to Abolish Nuclear Weapons was awarded the 2017 Nobel Peace Prize. International medical organisations, including the International Committee of the Red Cross, the IPPNW, the World Medical Association, the World Federation of Public Health Associations, and the International Council of Nurses, had key roles in the process leading up to the negotiations, and in the negotiations themselves, presenting the scientific evidence about the catastrophic health and environmental consequences of nuclear weapons and nuclear war. They continued this important collaboration during the First Meeting of the States Parties to the Treaty on the Prohibition of Nuclear Weapons, which currently has 92 signatories, including 68 member states.

We now call on health professional associations to inform their members worldwide about the threat to human survival and to join with the IPPNW to support efforts to reduce the near-term risks of nuclear war, including three immediate steps on the part of nuclear-armed states and their allies: first, adopt a no first use policy; second, take their nuclear weapons off hair-trigger alert; and, third, urge all states involved in current conflicts to pledge publicly and unequivocally that they will not use nuclear weapons in these conflicts. We further ask them to work for a definitive end to the nuclear threat by supporting the urgent commencement of negotiations among the nuclear-armed states for a verifiable, timebound agreement to eliminate their nuclear weapons in accordance with commitments in the NPT,
opening the way for all nations to join the Treaty on the Prohibition of Nuclear Weapons.

The danger is great and growing. The nuclear armed states must eliminate their nuclear arsenals before they eliminate us. The health community played a decisive part during the Cold War and more recently in the development of the Treaty on the Prohibition of Nuclear Weapons. We must take up this challenge again as an urgent priority, working with renewed energy to reduce the risks of nuclear war and to eliminate nuclear weapons.

This Comment is being published simultaneously in multiple journals. For the full list of journals see: https://www.bmj.com/content/full-list-authors-and-signatories-nuclear-risk-editorial-august-2023.
